

Four provisioning gotchas, four fixes

AREA	GOTCHA	FIX
01 Where SCIM stops	Native provisioning covers about 60% of the job. The rest is integration work.	Treat the other 40% as your build: pre-check UPN uniqueness , own proxyAddresses in one system, sequence steps across systems, and log every hop.
02 Entra ID to AD sync	Public preview with hard prerequisites. P1 covers only 2 configurations.	Run provisioning agent 1.1.2334.0 or later, verify msDS-ExternalDirectoryObjectId in the AD schema, and license Entra ID Governance beyond 2 configs.
03 AD to Entra ID sync	The AD user has to sync back, which adds one sync cycle to the Day-1 timeline.	Budget the cycle in the joiner SLA: start before Day 1, gate next steps on the user showing up in Entra ID, and use provision on demand for late hires.
04 Cross-system correlation	Correlating on run ID breaks as soon as a flow crosses systems.	Key on employeeId everywhere, add tracked properties to every action, send provisioning logs to Log Analytics , and add a dead-letter queue for retries.
